AbiBird®

How to

Read AbiBird Activity Graphs and Notifications

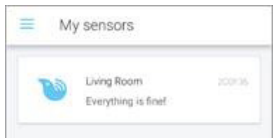

The AbiBird sensor monitors movement in a room and compares it to the daily routine set for the sensor in the AbiBird spp. Every hour AbiBird sends the data it has collected to the AbiBird app on your phone. If AbiBird detects an anomaly (movement not matching the set daily routine), it marks the activity as unusual and sends push and email notifications. The sensor also detects vibrations and will send an immediate 'Call for Help' if it detects a strong, continuous vibration.

AbiBird has three states:

1. Everything is fine
2. Unusual Activity
3. Call for Help

Everything is fine!

The *Everything is fine!* state means that the activity in the room matches the routine set in the AbiBird app.

Notifications	Homepage (Sensor List)	Sensor's graph page
<p>No notifications are sent.</p>	<p>The AbiBird homepage shows an <i>Everything is fine!</i> message for the sensor.</p> 	<p>A black dot appears on the sensor's graph indicating normal expected activity within the last 60 minutes.</p>  <p><i>The example shows there was activity (150 motion events) in the living room between 6:45am and 7:45am. Because the daily routine is set to expect this activity in the morning, AbiBird reports that everything is fine.</i></p> <p><i>The cared-for person is up and about as usual.</i></p>

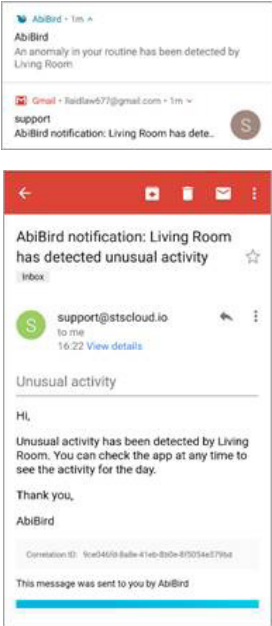

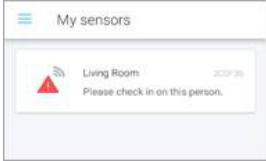

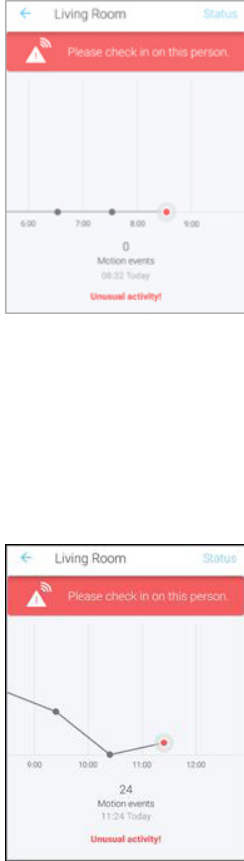

This guide is for all Smartphone users.

AbiBird®

Unusual activity

The *Unusual activity* state means that the activity in the room doesn't match the routine set in the AbiBird app.

Notifications	Homepage (Sensor List)	Sensor's graph page
<p>AbiBird marks the activity as unusual and sends a phone and email notification.</p> 	<p>The AbiBird homepage shows a <i>Please check on this person</i> message for the sensor.</p> 	<p>A red dot appears on the sensor's graph indicating either; there has been no activity in the room when there should be; or there's activity in the room when there shouldn't be.</p>  <p><i>This example shows there was no activity (0 motion events) in the living room between 7:32am and 8:32am.</i></p> <p><i>AbiBird has marked this as unusual because the daily routine is set for activity to begin at 6:30am and alert sensitivity is set for 2 hours. Thus, it's 2 hours since activity was expected to start in the room and there's been no movement.</i></p> <p><i>You may want to check on this person as they should be up and about by now.</i></p> <p>NOTE: You can scroll back through the graph to view activity over the last 24 hours. Tap an update (black dot) for the time and number of motion events recorded during that hour.</p> <p><i>This example shows there was activity (24 motion events) in the living room between 10:24am and 11:24am.</i></p> <p><i>AbiBird marked this as unusual because:</i></p> <ul style="list-style-type: none"> <i>a) the daily routine is set for activity to end at 10:00am when the person is expected to go out for the day;</i> <i>and b) alert sensitivity is set for 2 hours. Tapping the previous update (black dot) shows there were 3 motion events in the previous hour.</i> <p><i>Thus, there have been 27 movements over the last 2 hours, which suggests the person stayed home.</i></p> <p><i>You may want to call to find out why.</i></p>

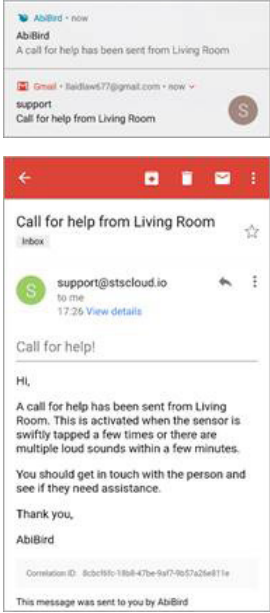

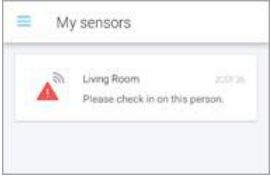

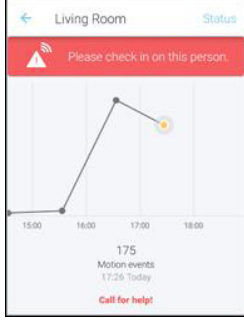

This guide is for all Smartphone users.

AbiBird

Call for Help

The *Call for Help!* state means that the cared-for person has activated the sensor's vibration sensor.

Notifications	Homepage (Sensor List)	Sensor's graph page
<p>AbiBird marks the activity as unusual and immediately sends a phone and email notification.</p> 	<p>The AbiBird homepage shows a <i>Please check on this person</i> message for the sensor.</p> 	<p>A yellow dot appears on the sensor's graph indicating a 'Call for Help' has been triggered.</p>  <p><i>The example shows there was a call for help at 5:26pm.</i></p> <p><i>While AbiBird isn't due to send an update until 5:30pm, a Call for help overrides the hourly update and is marked immediately.</i></p> <p><i>You would call this person immediately to check they are okay.</i></p>
